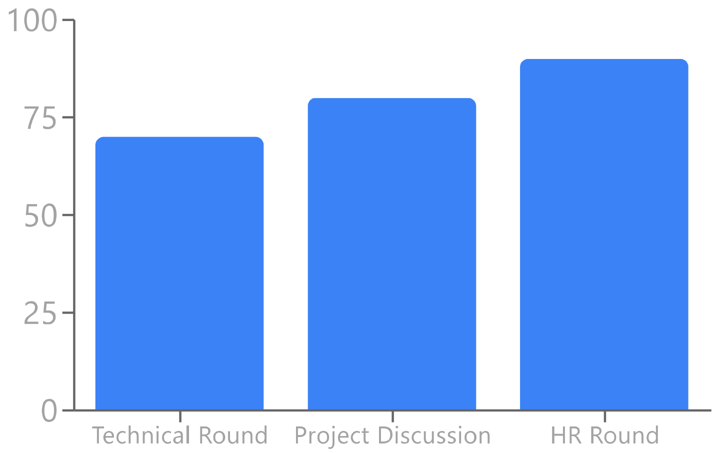
Job Match Score

TARGET: JAVA FULL STACK DEVELOPER

Skill Readiness

Core Java	**85%**
Spring Boot	**80%**
Frontend (React/JS/HTML/CSS)	**80%**
Databases (MySQL)	**75%**
Version Control (Git)	**90%**

Interview Confidence



✅ What to Highlight

- Proficiency in Java and Spring Boot for backend development.
- Strong frontend skills with React.js, HTML5, CSS3, and JavaScript.
- Experience with relational databases like MySQL.
- Competency in developer tools like Git & GitHub, VS Code, and IntelliJ IDEA.
- Ability to quickly learn complex technical concepts, demonstrated by AI/ML projects and academic achievements.

⚠️ What to Avoid

- Deep dives into the specific AI/ML algorithms of the projects without explicitly connecting them to transferable skills for a full-stack role (e.g., data handling, API integration challenges).
- Over-emphasizing Python/C++ skills unless specifically prompted or related to a full-stack context.

Expected Interview Questions

1. Explain the core components of a Spring Boot application and how you would build a RESTful API.
2. Describe the component lifecycle in React.js and how you manage state.
3. How do you connect a Spring Boot application to a MySQL database and perform CRUD operations?
4. What are common design patterns you would use when building a scalable web application?
5. Explain the differences between various HTTP request methods (GET, POST, PUT, DELETE) and their use cases.
6. Walk me through your process for debugging a full-stack application from frontend to backend.
7. How do you handle authentication and authorization in a web application?

🚨 Critical Risk Areas

Warning: Primary projects are heavily focused on AI/ML/NLP rather than full-stack web application development, which may lead to questions about practical application experience.

Confidence: Medium

Warning: Limited explicit demonstration of industry-standard practices like unit testing, integration testing, containerization (Docker), or cloud deployment in projects.

Confidence: Medium
